DEPT:ADS

Introduction:

In cloud computing, effective monitoring is crucial for ensuring the performance, reliability, and availability of cloud resources.

AWS CloudWatch provides a comprehensive monitoring solution for AWS resources, enabling users to track various metrics in real-time. This Proof of Concept (PoC) focuses on leveraging **CloudWatch** to monitor the performance of an EC2 instance by enabling basic monitoring for key metrics such as **CPU utilization** and **disk I/O**. This PoC demonstrates how to enable, view, and analyze these metrics, giving insights into the health and performance of cloud-based virtual machines.

Overview:

This PoC will walk through the process of setting up **AWS CloudWatch** to monitor an EC2 instance. The main steps include:

1. Enabling basic cloud monitoring for an EC2 instance.
2. Viewing key metrics such as **CPU utilization** and **disk read/write operations**, to assess the performance of the instance.
3. Exploring how CloudWatch provides real-time insights into the instance's resource usage, allowing administrators to identify performance bottlenecks or issues before they affect the service.

By completing this PoC, users will understand how to integrate CloudWatch monitoring for EC2 instances, enabling effective performance monitoring of virtual machines in the cloud.

Objective:

The primary objective of this PoC is to enable **basic cloud monitoring** using **AWS CloudWatch** and view essential metrics for an EC2 instance. Specific goals include:

Enabling CloudWatch monitoring for an EC2 instance.

Viewing CPU usage and **disk I/O** metrics to analyze the instance's performance.

Understanding how CloudWatch helps in real-time monitoring by providing visibility into cloud resource health.

Importance of this PoC:

1. Performance Monitoring: By tracking **CPU usage**, **disk I/O**, and **network traffic**, CloudWatch provides crucial insights into the resource utilization of an EC2 instance, which helps in identifying and troubleshooting performance issues.

2. Real-time Visibility: Enabling CloudWatch monitoring

ensures

that administrators have access to real-time data about the instance's performance. This allows quick reactions to

changes in resource consumption, preventing downtime or service degradation.

3. Resource Management: Understanding the resource consumption of the EC2 instance (such as CPU usage and disk I/O) helps in optimizing the instance's capacity and managing resources efficiently, which can also lead to cost savings.

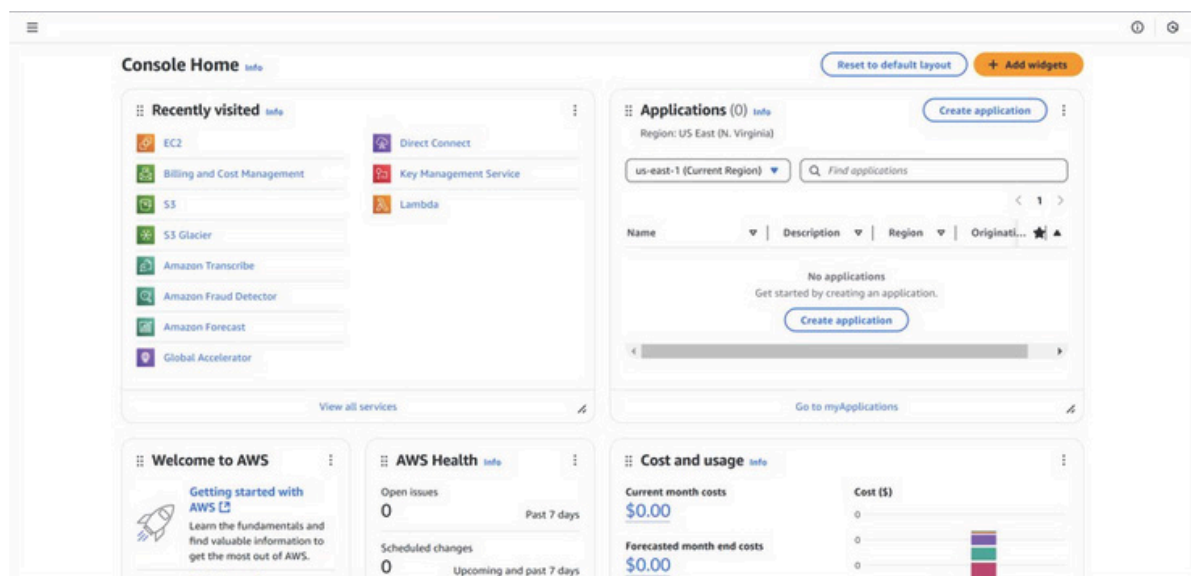

4. Proactive Issue Detection: CloudWatch allows the user to monitor

usage and understand patterns in the system's resource consumption, helping detect performance anomalies or bottlenecks before they become critical.

Step-by-Step Overview

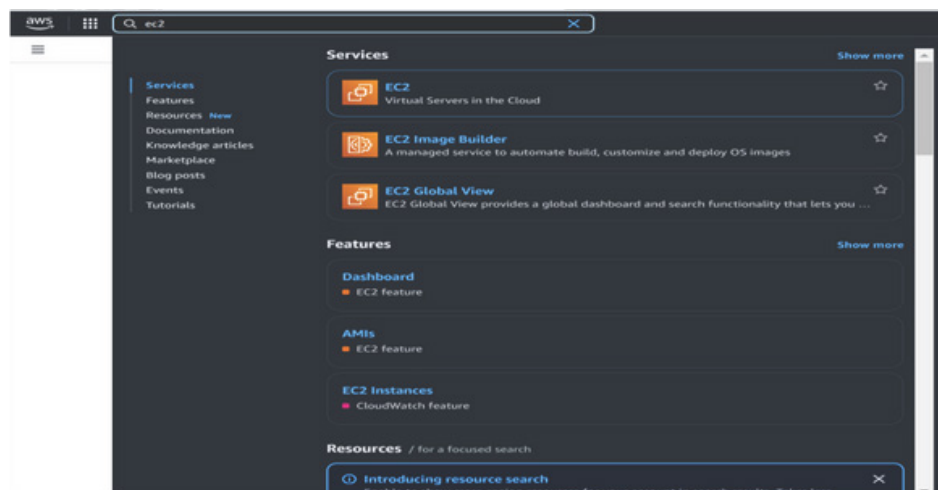

Step 1:

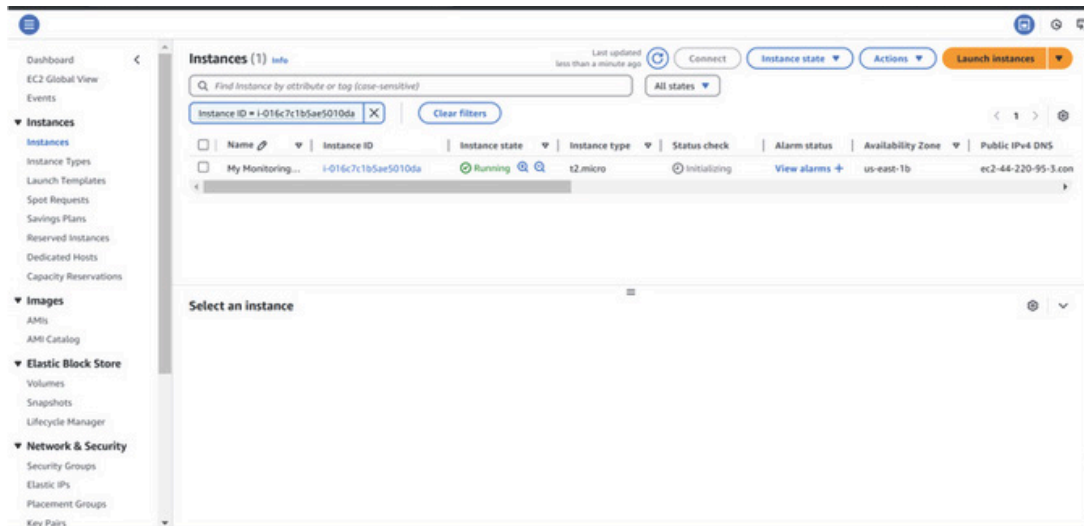

1. Go to [AWS Management Console](#).
2. Enter your username and password to log in.

Step 2:

On the EC2 Dashboard, click on **Launch Instances** and enter a name for your instance (e.g., "My Monitoring Instance"). Leave other settings as default and Click **Launch Instance**.

Step 3:

Go to the **EC2 Dashboard** in the AWS Console.

In the left menu, click **Volumes** under **Elastic Block Store (EBS)**.

Click **Create Volume**.

Step 4:

Once created, go to your **Volumes** list, select the newly created volume, and click **Actions** > **Attach Volume**.

The screenshot shows the AWS Management Console interface for an EBS volume. The left sidebar contains navigation links for EC2, Volumes, and various AWS services. The main content area displays the details for volume **vol-09f94e4749aca47f8**. Key information includes:

- Volume ID:** vol-09f94e4749aca47f8
- Size:** 100 GiB
- Type:** gp3
- IOPS:** 3000
- Volume state:** Available
- Availability Zone:** us-east-1a
- Created:** Fri Jan 31 2025 21:22:28 GMT+0530 (India Standard Time)
- Managed:** false
- Fast snapshot restored:** No
- Attached resources:** -
- Source:** Snapshot ID -
- Encryption:** Not encrypted
- KMS key ID:** -
- KMS key alias:** -
- KMS key ARN:** -
- Multi-Attach enabled:** No
- Operator:** -

At the top right, there are buttons for **Actions**, **Delete**, and **Modify**. The **Actions** dropdown menu is open, showing options: **Create snapshot**, **Attach volume** (highlighted), **Detach volume**, **Force detach volume**, and **Manage auto-enabled I/O**. Below the details, there are tabs for **Status checks**, **Monitoring**, and **Tags**. The **Status checks** tab is active, showing **Volume status** as **Ok** and **I/O status** as **Enabled**. The **Availability Zone** is **us-east-1a** and **I/O performance** is **Not applicable**.

The screenshot shows the **Attach volume** page in the AWS Management Console. The page title is **Attach volume** with an **Info** link. Below the title, it says: "Attach a volume to an instance to use it as you would a regular physical hard disk drive." The page is divided into sections:

- Basic details:**
 - Volume ID:** vol-09f94e4749aca47f8
 - Availability Zone:** us-east-1a
 - Instance:** i-01112bd21849d5773 (My Monitoring Instance) [running]
- Device name:** /dev/sdb

Below the device name, there is a note: "Newer Linux kernels may rename your devices to **/dev/xvdf** through **/dev/xvdp** internally, even when the device name entered here (and shown in the details) is **/dev/sdf** through **/dev/sdp**."

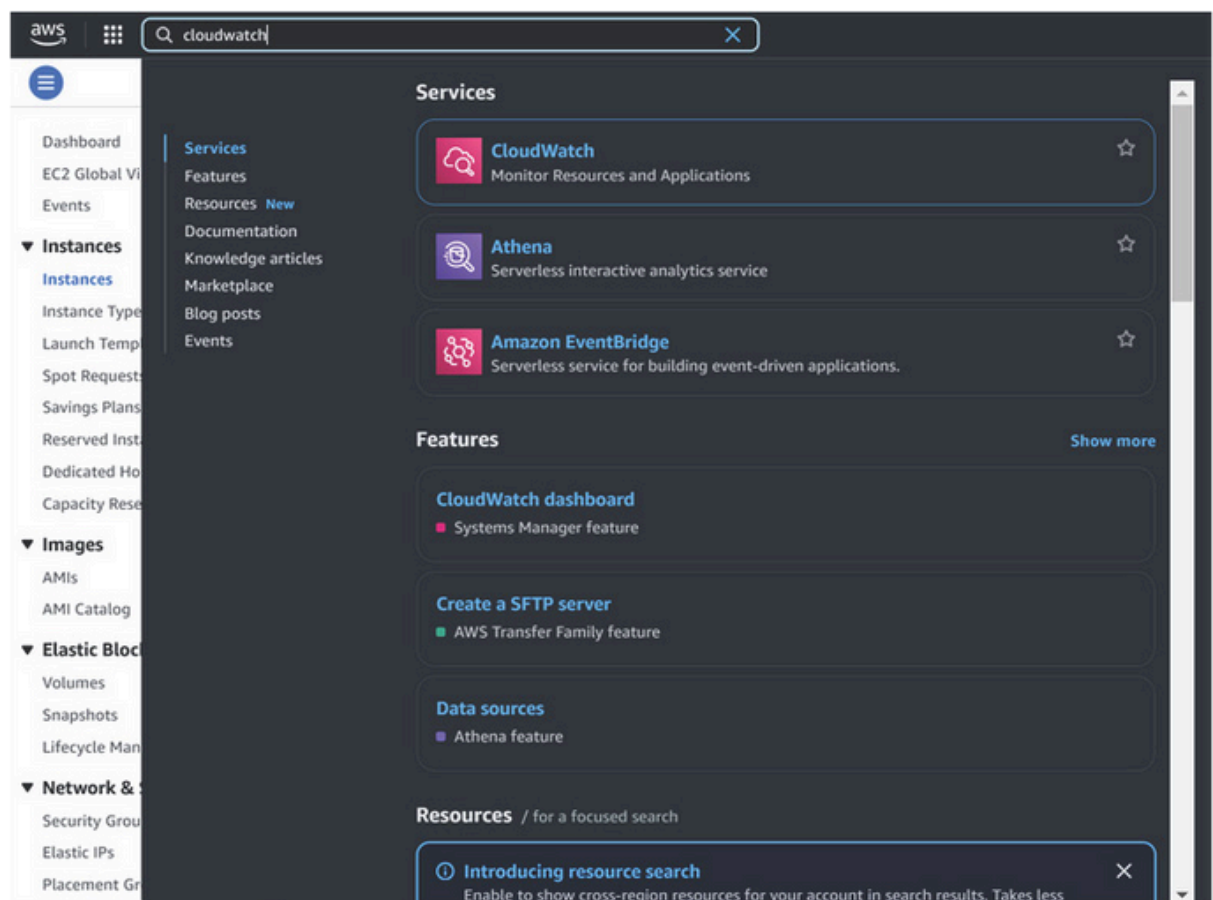

At the bottom right, there are two buttons: **Cancel** and **Attach volume** (highlighted in orange).

Step 5:

On the AWS Console homepage, look for the search bar at the top.

Type **CloudWatch** in the search bar and press **Enter**.

From the search results, click on **CloudWatch**.

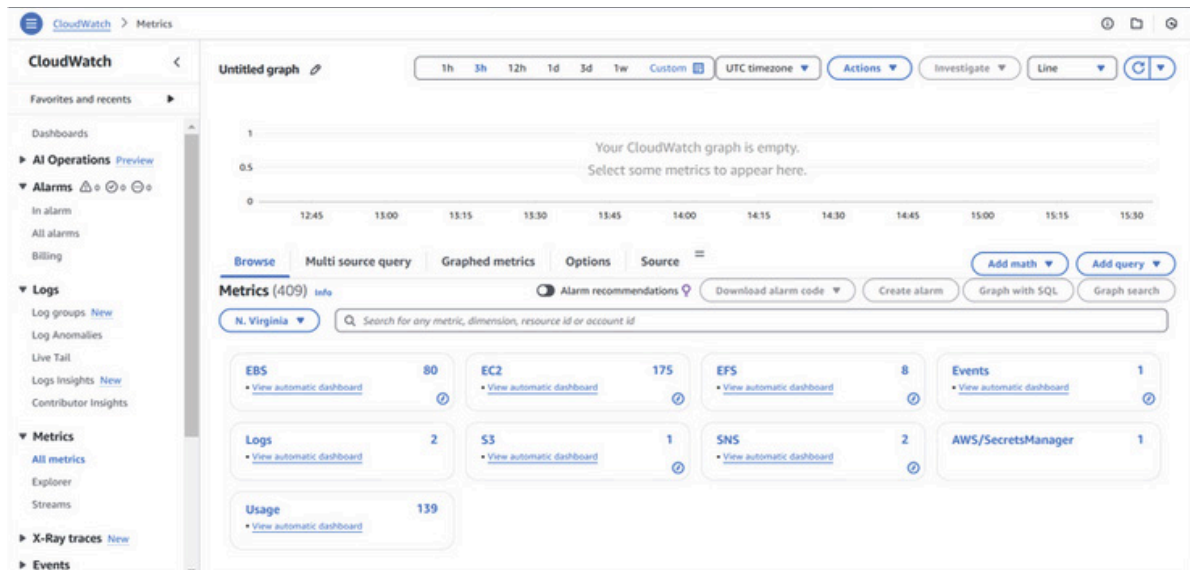

Step 6:

In the CloudWatch dashboard, look at the left-hand menu.

Click on **Metrics**.

Under **Browse**, click on **EC2**.

Then click on the **Per-Instance Metrics**.

Step 7:

You should now see a list of metrics for all your EC2 instances, such as:

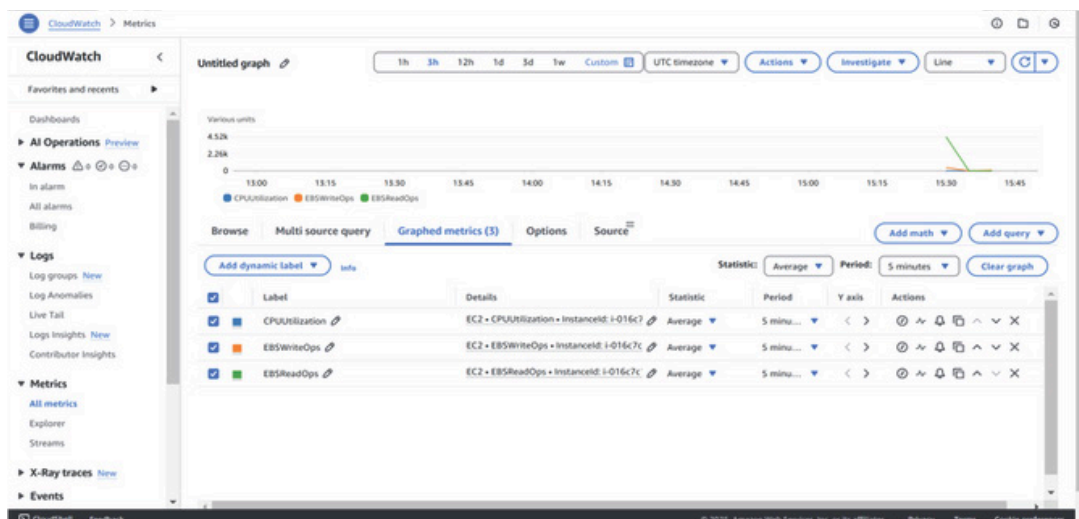

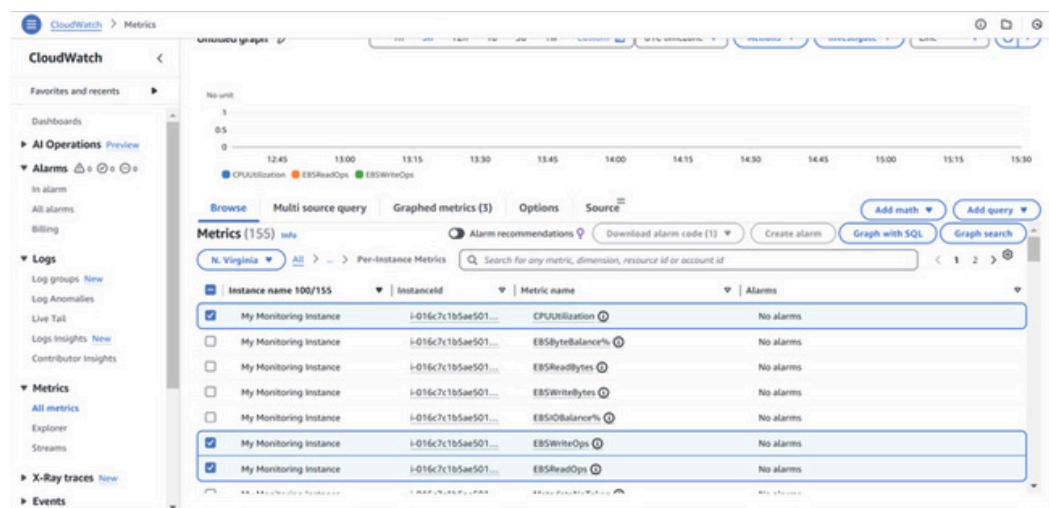

CPUUtilization (CPU usage)

DiskReadOps / DiskWriteOps (Disk I/O)

Identify the specific EC2 instance you want to monitor (it will be listed by its instance ID).

Click on the metrics associated with your instance

To view detail click Graphed metrics

Outcome

This Proof of Concept (PoC) aimed to establish a **cloud-based monitoring service** using **AWS CloudWatch** to track key performance metrics for an EC2 instance, specifically focusing on **CPU utilization** and **Disk I/O** (DiskReadOps and DiskWriteOps).

Here's the outcome of the PoC:

1. CloudWatch Setup: Successfully configured AWS **CloudWatch** to monitor EC2 instance metrics like **CPU utilization** and **Disk I/O** (DiskReadOps, DiskWriteOps).

2. Disk I/O Monitoring: Added an **EBS volume** to the EC2

instance

to track **DiskReadOps** and **DiskWriteOps** metrics, which were visualized in CloudWatch.

3. Cost Efficiency: The EBS volume was within the **AWS Free**

Tier

limits (30 GB), and all metrics stayed within **Free Tier** usage, incurring no additional cost.
